[Report a data error here](#)**Abstract of DE3206899**

An electro-oil-hydraulic lift which uses less drive power and requires little space. For this purpose, the car (1) is partly relieved by a spring element (4). The lifting cylinder (2), which moves the car (1) up and down, is connected in a communicating manner by a pressure-medium line (15) to a cylinder-piston unit (3), on the piston rod (10) of which the spring element (4) acts. The area of the piston base (16) of this cylinder-piston unit (3) is greater than the base area (17) of the piston (8) of the lifting cylinder (2) by at least the factor of ten. This results in a smaller stroke of the cylinder-piston unit (3) and a smaller spring force of the spring element (4).
